

Check Printer

Design & print custom bank checks

The complete user guide. Learn to build pixel-accurate check templates, position every field to the millimeter, auto-fill amounts in words, batch-print from a spreadsheet, and export print-ready PDFs — on macOS and Windows.

1 Introduction & key concepts

Check Printer lets you reproduce the exact layout of any pre-printed check and overprint the variable details — payee, date, amount — precisely where they belong.

Most banks issue blank or partially pre-printed check stock. The challenge is lining up what you print with the boxes and lines already on the paper. Check Printer solves this by letting you design a **template** that mirrors your check at true physical size, position each field down to the millimeter, then print onto the real stock or export a PDF.

Core concepts

True-to-size canvas

The on-screen check matches real millimeters, so what you place is what prints.

Fields

Draggable elements (date, payee, amount, etc.) you drop onto the check.

Templates

A saved layout (`.chktpl`) you reuse for each bank/check type.

CSV batch

Print many checks at once by mapping spreadsheet columns to fields.

Who it's for: small businesses, bookkeepers, and anyone who issues checks regularly and wants clean, repeatable alignment without buying proprietary software.

What you can do

- Set any check size in millimeters, or pick a preset (US Personal, Business, Voucher, A-size).
- Drag fields onto the check and see live distance guides from all four edges.
- Auto-convert the numeric amount into words, in English, with configurable cents style.
- Add the classic **A/C Payee Only** crossing in the corner.
- Save reusable templates, import them as a library, and lock them for fill-only use.
- Batch-print from a CSV and export single or multi-page print-ready PDFs.

2 The interface at a glance

The window has five areas: the toolbar, the document tab, the Fields panel (left), the design canvas (center), and the Inspector (right).

The Check Printer workspace — toolbar, tab, Fields panel, canvas with rulers, and Inspector.

Area	What it does
Toolbar (top)	New, Open, Import Template, Save · Import CSV, Export PDF, Print · About (i).
Document tab	Shows the current file. Untitled when new; the filename when opened or imported. A dot means unsaved changes. Close with ×.
Fields panel (left)	Drag fields onto the check; set check size, number format, live amount; lists imported templates.
Canvas (center)	The true-size check with rulers and grid. Drag fields here; the status bar shows live position in mm.
Inspector (right)	Edit the selected field — exact position, width, font, and field-specific options.

3 Quick start — your first check

From blank to printed in about five minutes.

- 1 **Set the size.** In the Fields panel under **Check Size**, pick a preset or type your check's exact Width and Height in millimeters (measure your stock with a ruler).
- 2 **Add fields.** Drag  **Pay to the Order of**,  **Date**, **\$ Amount (Figures)**, and  **Amount (Words)** from the left panel onto the check.
- 3 **Position them.** Drag each field to match your stock. While dragging, blue guides show the distance from the top, bottom, left, and right edges in millimeters. Fine-tune with exact numbers in the Inspector.
- 4 **Enter the amount.** Type a value in **Live Amount**. The figures field and the words field update automatically (e.g. *One Thousand Two Hundred Thirty-Four Dollars and 50/100 Only*).
- 5 **Test on plain paper.** Click  and print onto a blank sheet first. Hold it against your check stock to verify alignment, then adjust.
- 6 **Save the template.** Click  to store the layout as a  file. Next time, just Open it, fill in the details, and print.

Alignment tip: Always do step 5 on plain paper before feeding real checks. Printers vary by a millimeter or two; one test print saves a stack of wasted checks.

4 Setting the check size

Under **Check Size** in the Fields panel:

- **Preset** — choose US Personal (152.4 × 69.85 mm), US Business, US Voucher, or A-size.
- **Width / Height (mm)** — type exact values for any custom stock. Measure your real check edge-to-edge.
- **Show grid & rulers** — toggles the 5 mm grid and the edge rulers that help with alignment.
- **Snap to grid (1 mm)** — when on, dragging snaps to whole millimeters for tidy placement.

Measuring tip: Measure your check precisely with a millimeter ruler. The on-screen size equals the printed size, so an accurate measurement is the foundation of good alignment.

5 Adding & positioning fields

ADD A FIELD

Drag any chip from the Fields panel onto the check. It appears where you drop it and is selected, ready to edit.

MOVE A FIELD

Click and drag a field on the canvas. As you move it, four guide lines and labels show the exact distance to each edge — **L** (left), **R** (right), **T** (top), and **B** (bottom) — in millimeters. The status bar repeats these numbers.

POSITION PRECISELY

Select a field and use the Inspector's **Left**, **Top**, **Width**, and **Font** boxes to type exact millimeter values — ideal for matching pre-printed boxes.

FORMAT

The Inspector also offers **Bold** and **Align** (left / center / right) for every field, plus a **Delete field** button.

6 Field types & their options

Field	Purpose & options
 Date	Prints today's date (or custom text). Choose a format — <code>MM/DD/YYYY</code> , <code>DD/MM/YYYY</code> , <code>YYYY-MM-DD</code> , <code>Month DD, YYYY</code> , <code>DD Mon YYYY</code> , or type your own. Digit spacing inserts spaces between every character to line up with pre-printed date boxes, e.g. <code>0 2 - 3 1 - 2 0 2 6</code> .
 Payee	The recipient's name. Auto-shrinks and can wrap to multiple lines so long company names always fit.
\$ Amount (Figures)	The numeric amount. Set decimals (0–4), a currency prefix , optional thousands separator , and an optional boxed border (off by default, since many checks already have a printed box). Honors the US/European number-format switch.
 Amount (Words)	Generated automatically from the figure, in English. Choose cents style (<code>50/100</code> or <code>Fifty Cents</code>), the currency word, optional "Only", and UPPERCASE. Auto-shrinks and wraps for large amounts.
 Memo	A free-text note / "For:" line.
 Signature Line	A labeled signature line (e.g. "Authorized Signature").
T Custom Text	Any fixed text you need to overprint.
 MICR Line	A monospaced line for routing/account digits along the bottom of the check.

Number format (US vs European). The Fields panel has a switch: US/UK shows `1,234.50`; European shows `1.234,50` (period for thousands, comma for decimals). It applies to the amount-in-figures field.

OVERFLOW HANDLING (AUTO-FIT)

The Payee and Amount-in-Words fields have an **Overflow handling** section in the Inspector with **Auto-shrink font to fit**, **Wrap to multiple lines**, **Max lines**, and **Min font**. The text keeps its full size while it fits, and only shrinks toward the minimum when it would otherwise overflow.

7 Amounts: figures & words

Type the amount once; both the figures and the written words stay in sync.

The Live Amount box

In the Fields panel, the **Live Amount** box drives every amount field on the check. Change it and the figures and words update instantly. The green preview under it shows the words spelled out.

How words are generated

The words come straight from the number — for example **1,234.50** becomes *"One Thousand Two Hundred Thirty-Four Dollars and 50/100 Only."* You control:

- **Cents style** — (fraction) or (words).
- **Currency word** — "Dollars", "Pesos", "Euros", or anything you type.
- **Append "Only"** — adds the customary closing word.
- **Uppercase** — prints the whole line in capitals.

Large amounts always fit. With auto-shrink and wrap enabled (the default), even a figure in the billions spells out across up to three lines and scales down only as needed, so it never runs off the edge of the check.

Decimal & grouping format

Use the **Number Format** switch to match your locale. The amount-in-figures field follows it:

Style	Example	Thousands	Decimal
US / UK	1,234,567.50	comma	period
European	1.234.567,50	period	comma

8 The A/C Payee crossing

Many checks carry a diagonal "Account Payee Only" crossing in the upper-left corner, which restricts the check to deposit into the named payee's account. To add it:

1. In the Fields panel, open the **Crossing** section and tick **Diagonal crossing (top-left)**.
2. Edit the **Text** if needed (default: `A/C PAYEE ONLY`).

The crossing prints as two parallel slanted lines (running bottom-left to top-right) with the text centered between them. Long custom text **auto-shrinks and wraps** so it always fits between the lines.

9 Saving, opening & templates

SAVE A TEMPLATE

Click **Save** to write your layout to a `.chktpl` file. The tab adopts the filename, and the unsaved-changes dot clears. Template files are obfuscated, so they aren't casually editable in a text editor.

OPEN VS IMPORT

- **Open** loads a template for full editing.
- **Import Template** loads it in read-only **Use mode** — the layout is locked so you can fill and print without accidentally moving fields. Click **Edit** to unlock.

THE TEMPLATE LIBRARY

Every imported template is listed under **Imported Templates** in the Inspector. Click one to load it; remove it with ×. The library persists between sessions, so your bank templates are always one click away.

One document at a time. The app uses a single tab. Click **New** for a fresh Untitled check; closing the tab blanks the workspace until you start or open another.

10 Batch printing from CSV

Print a whole run of checks from a spreadsheet — payroll, vendor payments, refunds.

Prepare your CSV

Make a spreadsheet where the first row is column headers and each following row is one check. For example:

Payee	Amount	Date	Memo
Acme Supplies, Inc.	1234.50	03/07/2026	Invoice 1042
Maria Müller	1.250,75	03/09/2026	Refund

Amount cells accept both `1,234.50` and European `1.250,75` — the app detects which is which.

Import & map

- 1 **Click `Import CSV`**. The data opens in an editable table dock at the bottom of the canvas.
- 2 **Map columns to fields.** Select a field, and in its Inspector pick the matching **CSV column**. Common headers (Payee, Amount, Date, Memo) map automatically.
- 3 **Preview each row.** Click any row in the table to load it onto the check. The active row is highlighted.
- 4 **Edit in place.** Cells, headers, rows, and columns are all editable in the dock; use **Save CSV As** to keep your edits.

Print or export the batch

Use **Print all rows** to send every check to the printer, or **PDF all rows** to produce a single multi-page PDF — one check per page, each sized exactly to your check dimensions.

Per-row fit: Auto-shrink runs independently on every row, so a long payee name on row 12 is handled without affecting the rest of the batch.

11 Printing & exporting to PDF

Printing

Click **Print** to open your system print dialog. The check is rendered at exact physical size with no margins, so it lands on your stock precisely as designed.

Always test first. Print onto a blank sheet, lay it over a real check to confirm alignment, and only then load the actual check stock. Set your printer to 100% / "Actual size" — never "Fit to page", which rescales and ruins alignment.

Exporting a PDF

Click **Export PDF** to save a single check, or **PDF all rows** (with a CSV loaded) for the whole batch. Each PDF page is built to your exact check dimensions, ready to print or archive.

Printer settings checklist

Setting	Use
Scale	100% / Actual size — never "Fit to page".
Margins	None / minimum.
Paper size	Match or exceed your check dimensions.
Orientation	Usually landscape for checks.

12 Tips, troubleshooting & FAQ

ALIGNMENT IS SLIGHTLY OFF

Re-measure your check and confirm the Width/Height match. Make sure the printer is at 100% scale with no "fit to page". Nudge fields by 0.5–1 mm in the Inspector and re-test on plain paper.

THE AMOUNT IN WORDS RUNS OFF THE CHECK

Select the Amount-in-Words field and ensure **Auto-shrink** and **Wrap to multiple lines** are on (default). Increase **Max lines** or lower **Min font** if you print very large amounts.

A DATE NEEDS TO LAND IN PRE-PRINTED BOXES

Select the Date field and set **Digit spacing** to 1 (or more) to space out each character so the digits align with the boxes, e.g. `0 2 - 3 1 - 2 0 2 6`.

I DON'T WANT A BOX AROUND THE AMOUNT

The amount box is off by default. If one appears, select the field and untick **Boxed border**.

MY TEMPLATE OPENED SHOWING "UNTITLED"

Templates now adopt their filename as the tab name. Re-save with **Save** to refresh the name if you opened an older file.

CAN I RUN IT ON WINDOWS?

Yes. The app runs on both macOS and Windows. On Windows you may see a SmartScreen notice for an unsigned app — click "More info" then "Run anyway"; it installs and runs normally.

IS MY DATA SENT ANYWHERE?

No. Check Printer runs entirely on your computer. Templates and CSVs stay on your machine.

Need a clean reprint? Keep a small stack of plain paper handy for alignment tests, and save a template per bank so every future check is just Open → fill → Print.
